Ash Creek Community Water System System# AZ0405007 Annual Drinking Water Quality Report For 2024

shutterstock.com · 224244121

We're very pleased to provide you with this year's Annual Water Quality Report. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is and always has been, to provide you with a safe and dependable supply of drinking water. Ground water is the source from which our water comes. Based on the information currently available on the hydrogeological settings of and the adjacent land uses that are in the specified proximity of the drinking water source(s) of this public water system, the Arizona Department of Environmental Quality has given us a "low risk" designation for the degree to which this public water system drinking water source(s) are protected. A low-risk designation indicates that most source water protection measures are either already implemented, or the hydrogeology is such that the source water protection measures will have little impact on protection. We have 2 wells that we draw from. The well field is located just east of the Cluff Ranch Wildlife Area. The water is chlorinated and then pumped into a 20,000-storage tank at the same site.

Graham County Electric Cooperative routinely monitors constituents in your drinking water according to Federal and State laws. This table shows the results of our monitoring for the period of January 1st to December 31st, 2024. As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances. All drinking water, including bottled drinking water, may be reasonably expected to contain at least some small amounts of constituents. It's important to remember that the presence of these constituents does not necessarily pose a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791. Graham County Electric Cooperative is pleased to report that our drinking water is safe and meets Federal and State requirements.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions: **Parts per million (ppm) or Milligrams per liter (mg/l)** - one part per million corresponds to one minute in two years or a single penny in \$10,000. **Parts per billion (ppb) or Micrograms per liter** - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000. **PPT:** Parts per trillion or Nanograms Per liter (ng/l), equal to 1000 parts ppb. **Ppq:** Parts per Quadrillion or Picograms per liter (pq/l), equal to 1000 ppt. **Picocuries per liter (pCi/L)** - Picocuries per liter is a measure of the radioactivity in water. **Action Level or "AL"** - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. **No Detect or ND:** No detection of the contaminant or the contaminant was less than the detectable limit. **Maximum Contaminant Level or "MCL"** is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology. **Maximum residual disinfectant level or "MRDL"** means the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. **Maximum Residual disinfectant level Goal:** The Level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLG's do not reflect the benefits of the use of disinfectants to control microbial contaminants. **Treatment Technique (TT):** There is convincing evidence that the addition of a disinfectant is necessary for control of microbial contaminants.

TEST RESULTS

Contaminant	Violation Y/N	Running Annual Average (RAA) <u>OR</u> Highest Level Detected	Range of all Samples	MCLG	MCL	Likely Source of Contamination	Date Tested
GROSS ALPHA (pCi/L)	N	ND	ND	0	15	Erosion of natural deposits	Feb. 2019
Combined Radium (pCi/L)	N	ND	ND	5	5	Erosion of natural deposits	Feb. 2019
Copper (ppm)	Y	90th percentile =.0073	ND-.0078	1.3	AL=1.3	Corrosion of household plumbing systems; Erosion of natural deposits; leaching from wood preservatives	Sept 2024
Lead (ppB)	Y	90 th percentile =ND	ND	0	AL=15	Corrosion of household plumbing systems, Erosion of natural deposits	Sept. 2024
Nitrate (ppm)	N	ND	ND	10	10	Runoff from fertilizer use; leaching from septic tanks; sewage; erosion of natural deposits	Jan 2024
Arsenic (ppb)	N	4.5	4.5	10	10	Erosion of natural deposits, runoff from orchards, runoff from glass and electronics production wastes	Oct. 2022
Barium (ppb)	N	30	30	200	200	Discharge of drilling wastes; discharge from metal refineries; Erosion of natural deposits	Oct. 2022
Fluoride (ppm)	N	2.1	2.1	4	4	Erosion of natural deposits; water additive which Promotes strong teeth; discharge from fertilizer and aluminum factories	Dec. 2022
Sodium (ppm)	N	230	230	3000	3000	Erosion of natural deposits	Jan 2024
Chromium (ppb)	N	ND	ND	100	100	Discharge from steel and pulp mills; erosion of natural deposits	Oct. 2022
HAA5 (ppb)	N	ND	ND	60	60	By-products of drinking water chlorination	July. 2024
TTHM (ppb)	N	1.31	1.31	80	80	By-products of drinking water chlorination	July 2024
Chlorine (ppm)	N	..25	.08-.5	4	4	Water additive used to control microbes	Monthly 2024
MERCURY (ppb)	N	.25	.25	2	2	Inorganic mercury compounds are the most common forms of mercury found in drinking water. Organic mercury compounds are rarely found in drinking water.	Oct 2022

PFAS (ppt)	N	ND	ND		2 ng/l		Sept 2024
PFOS (ppt)	N	ND	ND		2 ng/l		Sept 2024
PFOA (ppt)	N	ND	ND		2 ng/l		Sept 2024
PFBS (ppt)	N	ND	ND		2 ng/l		Sept 2024

Lead and copper samples have been taken in 2024. Nitrite samples were taken in 2022. These are the most current test results and were done in compliance with current regulations.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

To ensure that tap water is safe to drink, EPA prescribes regulations, which limit the number of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

MCL's are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised people such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

While your drinking water meets EPA's standard for arsenic, it does contain low levels of arsenic. EPA's standard balances the current understanding of arsenic's possible health effects against the cost of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems. Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than 6 months of age. High nitrate levels in drinking water can cause "blue baby syndrome." Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask advice from your health care provider.

Graham County Electric Cooperative is responsible for providing high quality drinking water and removing lead pipes but cannot control

the variety of materials used in plumbing components in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk.

To address lead in drinking water, public water systems were required to develop and maintain an inventory of service line materials by Oct 16, 2024. Developing an inventory and identifying the location of lead service lines (LSL) is the first step for beginning LSL replacement and protecting public health. The lead service inventory may be viewed online at: <https://adeq.120water-ptd.com/>. Please contact us if you would like more information about the inventory or any lead sampling that has been done.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Graham County Electric Cooperative is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, or you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/lead.

We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected. The EPA has determined that your water is safe at these levels.

Thank you for allowing us to continue providing your family with clean, quality water this year. In order to maintain a safe and dependable water supply we sometimes need to make improvements that will benefit all of our customers. These improvements are sometimes reflected as rate structure adjustments. Thank you for understanding.

We at Graham County Electric Cooperative work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

If you have any questions about this report or concerning your water utility, please contact Josh Bryce 485-8653 or Ethan Estes at 485-8667. You may also find real-time information about our water system at the Arizona Department of Environmental Quality (ADEQ) Drinking Water Watch website at <https://azdewis.azdeq.gov/DWW>. We want our valued customers to be informed about their water utility. If you would like, please attend any of our regularly scheduled board meetings. They are held on the first Wednesday of every month. Please call for the time and to make an appointment if you would like to attend.
